Software Engineer - Frontend (Remote) | CoinTracker

Hello! As a CoinTracker user and advocate, I'm so excited to find this Frontend Software Engineer position. I can't think of a position I'd be more motivated about than working with you all to continue to improve your already great product.

So, how can I help you all? In lots of ways! Over my 15-year career, I've become a true T-Shaped web/software engineer. Front-End engineering is where I have the most expertise and interest, but I've been tasked with design and Back-End engineering jobs my entire career, and I've become skilled at learning new things in order to stay on the cutting edge, because we all know how fast the industry can evolve. I currently work for myself, which has truly made a self-starter and I've gained invaluable experience learning to work 100% on my own at times, as well as leading projects with a team of developers.

One thing that sets me apart from other engineers is my attention to detail when it comes to the user experience. I'm very design-oriented, so pixel perfection and thoughtful interactions is something you'll get with me.

I'm very familiar with a lot of the tools you all use, and interested in the ones I've not had a chance to use yet. The tools/languages I currently use are: HTML, Typescript, React, Svelte, Figma, TailwindCSS, CSS, Sass, GraphQL,

Postgres, Heroku, AWS, Github, Google Meet, Notion, Slack, Discord.

If you've made it this far, I appreciate your determination to find the right fit for CoinTracker. I'd love for that to be me! If you have any questions about my experience, skills, or anything else, please reach out to me at email@kenjones.pizza

Thanks for the consideration!
-Ken
